intelligent sensors

GEALAN-SENSE® window Opening Sensor

Invisible opening sensors from GEALAN consist of two parts: a state sensor and a magnet. The state sensor is mounted concealed on the hardware of the window sash and thereby detects the position of the window handle. The magnet is mounted in the rebate of the window frame and serves to detect the window position. This combination causes a loud alarm to be triggered via the integrated alarm transmitter if an attempt is made to break in as soon as the window is prised open.

GEALAN-SENSE® glass Glass breakage sensor

If intruders try to smash windows to break into your home, the visible glass breakage sensor on your window will immediately alert you with a powerful audible alarm.

As a preventive feature, a light emitting diode on the sensor can be activated. This light flashes red through the window at intervals of 60 seconds and signals that the window is being monitored.

The battery-operated GEALAN-SENSE® glass+ sensor optionally uses wireless signal transmission to automatically inform you in case of glass breakage.

Product features
